

Task 4 - Individual Reflection

1. What is the strongest cloud concept represented in your capstone project?

The strongest cloud concept in my project is **serverless cloud computing**. SentinelX uses serverless functions to analyze threats and calculate risk scores without managing servers. This improves efficiency, reduces infrastructure overhead, and allows automatic scaling when the workload increases.

2. Where will elasticity or scalability become important in your capstone product?

Elasticity and scalability become important when many users or threat logs are processed at the same time. Cloud resources can automatically scale up during heavy traffic and scale down when demand decreases, ensuring good performance and cost efficiency.

3. Which API or web-service idea is most relevant to your project and why?

REST APIs are the most relevant because they enable secure communication between the web application, NLP engine, serverless functions, and cloud database. They allow different components of SentinelX to exchange data quickly and reliably.

4. What did you personally understand better after preparing this concept map and matrix?

After preparing this assessment, I gained a better understanding of cloud service models, deployment models, APIs, virtualization, and serverless computing. I also learned how these concepts work together to build a secure and scalable cloud-based cybersecurity application.
